## Environmental Engineering

## 4. Natural ventilation

Bachelor degree course
Vladimír Zmrhal

## Principle of ventilation

## Natural ventilation

is driven by pressure differences across the building envelope, caused by wind and air density differences because of temperature differences between indoor and outdoor air
$>$ the flow of air through open windows, doors, grilles and other planned building envelope penetrations
Mechanical (forced) ventilation
$>$ intentional movement of air into and out of building using mechanical force
> is driven by fans

## Hybrid ventilation

## Natural ventilation

The air flow is driven by pressure differences across the building envelope.
Pressure difference is caused by:
> air density differences (temperature differences between indoor and outdoor air)
$>$ wind pressure

Natural ventilation
$>$ natural ventilation by large openings (permanent)
shaft ventilation (permanent)

heat source
$>$ interupted natural ventilation (time limited)
$>$ infiltration (time limited)

depends on outdoor climatic conditions

## Natural ventilation

Balanced natural ventilation
$>$ for ventilation in industry with permanent heat gain - natural ventilation by large openings
> infiltration and interrupted ventilation - residential application etc.

## Natural local exhaust

$>$ shaft ventilation - industry

## Natural ventilation

Stack pressure - hydrostatic pressure caused by the mass of a column air located inside or outside a building

## Natural ventilation

Stack pressure difference
$p_{0}=p-\rho_{0} g y$
$p_{i}=p-\rho_{i} g y$
$\Delta p=p_{i}-p_{0}=p-\rho_{i} g y-\left(p-\rho_{0} g y\right)=g y\left(\rho_{0}-\rho_{i}\right)$
$\Delta p_{\max }=g \int_{0}^{h}\left(\rho_{o}-\rho_{i}\right) d y$
$\Delta p_{\max }=g h\left(\rho_{o}-\rho_{i}\right)$

Natural ventilation

## Natural ventilation

Wind pressure
$p_{w}=C_{p} \frac{w^{2}}{2} \rho$

where $C_{p}$ is wind surface pressure coefficient (empirical); it depends on wind direction, orientation of the building surface, ... $C_{p}=-1.4$ to 1.4

Natural ventilation by large openings

## Technical rooms

(boiler room, current transformer room, junction exchange station, ...)

$\rightarrow$ Goal $=$ design of openings area $A_{\text {ex }}, A_{\mathrm{s}}$

## Natural ventilation by large openings

Mass air flow
$\dot{M}=\frac{\dot{Q}}{c\left(t_{e x}-t_{s}\right)}$
Openings area

$$
\begin{aligned}
& t_{s}=t_{0} \\
& t_{i}=\frac{t_{o}+t_{e x}}{2}
\end{aligned}
$$

$M_{e x}=M_{s}=M$
$\mu_{e x} A_{e x} \rho_{e x} W_{e x}=\mu_{s} A_{s} \rho_{s} W_{s} \leftarrow W_{s}=\sqrt{\frac{2 \Delta p_{s}}{\rho_{s}}}$
$\frac{\Delta p_{s}}{\Delta p_{e x}}=\frac{\mu_{e x}^{2}}{\mu_{s}^{2}} \frac{\rho_{e x}}{\rho_{s}} \frac{A_{e x}^{2}}{A_{s}^{2}}$

Natural ventilation by large openings
Discharge coefficient for opening $\mu$
$\mu=\alpha \varphi$

| where $\varphi$ | ...velocity coefficient [-] |
| :---: | :---: |
| $\alpha$ | ...coefficient of contraction [-] |
| $\varphi=\frac{w}{w_{t}}$ | real and theoretical velocity ratio |
| $\alpha=\frac{A^{\prime}}{A}$ | real and theoretical area ratio |
| $\mu=\frac{w A^{\prime}}{W_{t} A}=\frac{V}{V_{t}}$ | real and theoretical volume flow ratio |

## Natural ventilation by large openings

Discharge coefficient of opening $\mu$

| Opening | H/B | Shutter angle $\boldsymbol{\alpha}$ |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathbf{1 5}$ | $\mathbf{3 0}$ | $\mathbf{4 5}$ | $60^{\circ}$ | $\mathbf{9 0 ^ { \circ }}$ |
| Supply air with <br> louver |  | 0,15 | 0,3 | 0,44 | 0,56 | 0,64 |
|  |  | 0,13 | 0,27 | 0,39 | 0,56 | 0,61 |
|  |  | 0,15 | 0,3 | 0,44 | 0,56 | 0,64 |
|  |  | 0,13 | 0,27 | 0,39 | 0,56 | 0,61 |

Natural ventilation by large openings
Pressure difference (stack effect)

$$
\Delta p=h g\left(\rho_{0}-\rho_{i}\right) \quad \rho=1,293 \frac{p}{101325} \frac{273}{273+t}
$$

for pressure differences $\Delta p_{s^{\prime}} \Delta p_{\text {ex }}$ can be written
$\Delta p=\Delta p_{s}+\Delta p_{\text {ex }}$
Openings area $\left[\mathrm{m}^{2}\right]$

$$
A_{s}=\frac{M_{s}}{\mu_{s} \sqrt{2 \Delta p_{s} \rho_{s}}} \quad A_{e x}=\frac{M_{e x}}{\mu_{\mathrm{ex}} \sqrt{2 \Delta p_{e x} \rho_{e x}}}
$$

Natural ventilation of technical room

Example 1: Junction exchange station
Calculate $A_{s}=$ ? and $A_{\text {ex }}=$ ?

| Internal heat gains | $Q=5 \mathrm{~kW}$ |  |
| :--- | :--- | :--- |
| Outdoor air temperature | $\boldsymbol{t}_{\mathrm{o}}=30^{\circ} \mathrm{C}$ | (in summer) |
| Max. indoor air temperature | $t_{i}=35^{\circ} \mathrm{C}$ | (in summer) |
| Atmospheric pressure | $p=100 \mathrm{kPa}$ |  |
|  |  |  |
| $h=3 \mathrm{~m}$ |  |  |
| $\mu_{\mathrm{s}}=\mu_{\mathrm{ex}}=0.65$ | $\rho=1.293 \frac{\rho}{101325} \frac{273}{273+t}$ |  |
| $\boldsymbol{A}_{\mathrm{ex}}=A_{\mathrm{s}}$ |  |  |

Natural ventilation by louvers
Large industrial halls

## Natural ventilation by louvers

Pressure difference (stack effect)

$$
\Delta p=h g\left(\rho_{0}-\rho_{i}\right) \quad t_{i}=\frac{t_{o z}+t_{e x}}{2}
$$

Vertical air temperature changes $\rightarrow$
coefficient of heat removal efficiency $B[-]$
$B=\frac{M_{\text {rec }}}{M+M_{\text {rec }}}$

## Natural ventilation by louvers

Heat balance
$M_{\text {rec }} c t_{e x}+M c t_{0}=\left(M+M_{\text {rec }}\right) c t_{o z}$
$B=\frac{t_{o z}-t_{0}}{t_{e x}-t_{0}}<1$

$$
B=0,25 \text { to } 0,4
$$

Summer: $\quad t_{0 z}-t_{0} \leq 5 \mathrm{~K} ; \quad t_{0}=25^{\circ} \mathrm{C}$
$\Rightarrow$ Winter: $\left.\quad t_{0 z, \text { min }}=10^{\circ} \mathrm{C} ; t_{0}=0^{\circ} \mathrm{C} \quad\right\} \quad$ in Czech Rep.

## Natural ventilation by louvers

Heat coefficient B

| Industry application |  | $\boldsymbol{B}$ |
| :--- | :--- | :---: |
| Steel mill | basic furnace | $0,30-0,35$ |
|  | electric furnace | $0,35-0,40$ |
|  | cast hall | $0,25-0,30$ |
| Rolling mill | furnace | $0,25-0,30$ |
|  | rolling section | $0,25-0,45$ |
| Foundry | melting-house, cupola | $0,40-0,45$ |
|  | cast into ingots | $0,37-0,40$ |
|  | cooling section | $0,65-0,70$ |
| Glass factory | tank furnace | $0,26-0,30$ |
|  | pot furnace | $0,26-0,28$ |

## Natural ventilation by louvers

Louvers (large openings) area calculation
$>$ see page 11 to 14

Location of the openings in summer (by the floor) and winter (smaller openings and higher location - up to 4 m ).

## Shaft ventilation

$>$ pressure difference due to stack effect
$\Delta p=h g\left(\rho_{0}-\rho_{i}\right)$
pressure loss (friction and local losses)
$\Delta p_{\text {loss }}=\left(\lambda \frac{l}{d}+\sum \zeta+1\right) \frac{w^{2}}{2} \rho_{i}$
$\Delta p \geq \Delta p_{\text {loss }}$
$\dot{V}=\frac{Q}{\rho c\left(t_{i}-t_{0}\right)}$

## Shaft ventilation

assumption: the pressure in the shaft is approximately equal to atmospheric pressure
$p_{i}=p_{0}$
effect of the area of the supply opening

## Infiltration

uncontrolled natural ventilation through the cracks, gaps around closed windows and doors, mortar joints
> air leakage through the building envelope
possitive effect of infiltration $\rightarrow$ ventilation
$>$ negative effect of infiltration $\rightarrow$ heat losses in winter
present $\rightarrow$ tight windows

## Infiltration

Airflow through the gaps
$V_{o}=\sum(i \cdot l) \Delta p^{n}$
where $\quad \Delta p$...pressure difference across the leakage path [Pa]
i ... flow coefficient [m³/(s.m. $\left.\mathrm{Pa}^{0,67}\right)$ ]
I ... lenght of the gaps [m]
$n$... flow exponent $n=0,67$
Ventilation heat loss
$Q_{\text {vent }}=V_{o} \rho c\left(t_{i}-t_{0}\right)$

## Infiltration

## Example:

Room $10 \mathrm{~m}^{2}$, height $2,6 \mathrm{~m}$, window $1,2 \times 1,5 \mathrm{~m}, t_{0}=-12^{\circ} \mathrm{C}, \mathrm{t}_{\mathrm{i}}=20^{\circ} \mathrm{C}$

|  | $\boldsymbol{i}\left[\mathrm{m}^{3} /\left(\mathrm{m} . \mathrm{s} \cdot \mathrm{Pa}^{0,67}\right)\right]$ | $\boldsymbol{I}\left[\mathrm{h}^{-1}\right]$ | $\boldsymbol{Q}_{\text {vent }}[\mathrm{W}]$ |
| :--- | :---: | :---: | :---: |
| Old windows | 0,00019 | 0,80 | 240 |
| Requirements | 0,00001 to 0,000087 | 0,02 to 0,36 | 6 to 109 |
| Common windows | 0,000025 | 0,10 | 31 |
| Top windows | 0,000004 | 0,02 | 5 |

## Interupted natural ventilation

$>$ casual opening of the window
$>$ lower and higher parts of the window
mass balance
$\dot{M}_{o}=\dot{M}_{e x}=\dot{M}$
$\dot{M}_{0}=\mu \rho_{e} W_{0} S_{0}$

$$
d \dot{M}=\mu \rho_{o} \sqrt{\frac{2 \Delta p_{x}}{\rho_{o}}} b d x=\mu \sqrt{2 g x\left(\rho_{o}-\rho_{i}\right) \rho_{e}} b d x
$$

## Interupted natural ventilation

$$
\begin{aligned}
& M=\mu b \sqrt{2 g\left(\rho_{o}-\rho_{i}\right) \rho_{o}} \int_{0}^{h / 2} x^{1 / 2} d x=\mu b \sqrt{2 g\left(\rho_{0}-\rho_{i}\right) \rho_{0}} \frac{2}{3}\left(\frac{h}{2}\right)^{3 / 2} \\
& =\mu \frac{2}{3} b \sqrt{2 g\left(\rho_{o}-\rho_{i}\right) \rho_{o}\left(\frac{h^{3}}{8}\right)} \cdots \\
& M=\mu \frac{1}{3} b \sqrt{g\left(\rho_{o}-\rho_{i}\right) \rho_{o} h^{3}}
\end{aligned}
$$

| Example 3: Calculate $M_{0}=?$ | HOMEWORK |
| :--- | :--- |
| Dimensions of window | $\boldsymbol{b} \times \boldsymbol{h}=1.2 \times 1.2 \mathrm{~m}$ |
| Discharge coefficient of window | $\mu_{\text {vin }}=0.65$ |
| Atmospheric pressure | $\boldsymbol{p}=100 \mathrm{kPa}$ |
| Summer: |  |
| Outdoor air temperature | $t_{o}=30^{\circ} \mathrm{C}$ |
| Indoor air temp. | $t_{i}=24^{\circ} \mathrm{C}$ |
| Winter: | $t_{o}=0^{\circ} \mathrm{C}$ |
| Outdoor air temperature | $t_{i}=20^{\circ} \mathrm{C}$ |
| Indoor air temp. |  |
